**HOW SAFE IS SAFE ENOUGH?**  
Measuring and Predicting  
Autonomous Vehicle Safety

PHILIP KOOPMAN

**The UL 4600  
Guidebook**  
What to Include in an  
Autonomous Vehicle  
Safety Case

# A Safety Framework for Shared Human/Computer Driving Responsibility

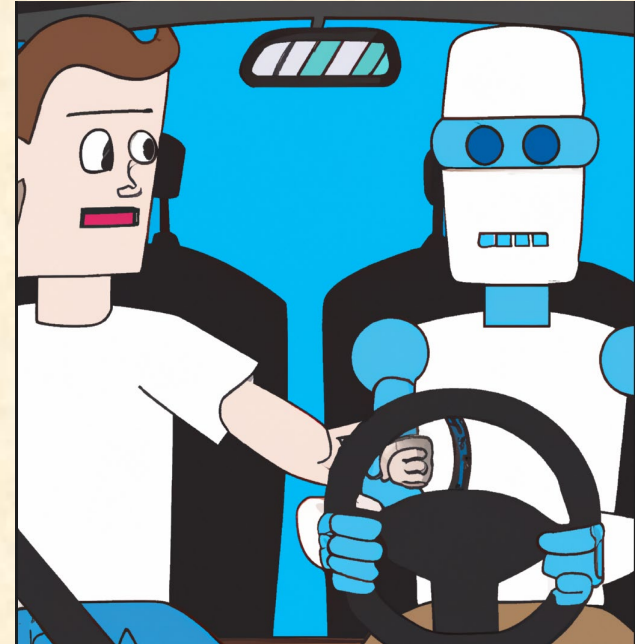

**Prof. Philip Koopman**

June 30, 2023

[www.Koopman.us](http://www.Koopman.us)

**Carnegie  
Mellon  
University**

- “Computer Driver” as a concept
  - Same duty of care as a human driver
  - Perform as a “reasonable driver”
- What about shared responsibility?
  - Effective driver monitoring
  - Reasonable responsibility transfer process
- State liability laws play a key role
  - Buys time to sort out equipment regulation
  - Can work with a non-statistical definition of “safe enough”

[Dall-E]

# Key Approach: Computer Driver

- Need more than statistical approach when computer drives
  - Challenges to predicting initial safety outcomes
  - Defective behaviors masked by net safety improvements
  - Risk redistribution to vulnerable populations
- Computer Driver should have a duty of care
  - Obligation to be a “reasonable driver”
    - Same criterion as for human driver negligence
- Comparison is “reasonable human driver” ...  
... not “average human driver”
  - Manufacturer is responsible party for negligent computer driving

[Dall-e]

# Three “Pure” Operational Modes

## CONVENTIONAL

- Conventional: Human Driver steers
  - Human Driver responsible

## AUTONOMOUS

- Fully Autonomous: Computer Driver steers
  - Manufacturer is responsible for Computer Driver

## TESTING

- Testing: Development, Beta, Pre-production
  - Manufacturer is responsible for safe test plan, qualification and performance of test drivers

# The Awkward Middle: Supervisory Mode

- Human Supervises automated Control of steering
  - Computer Driver has sustained control of steering
  - Prone to Human Driver automation complacency
- This mode includes:
  - Driver told secondary tasks forbidden/acceptable
  - Hands on/off wheel
  - Eyes on/off road
- Unify SAE Levels 2-3 into single, flexible regulatory approach

# Need Rules To Avoid Moral Crumple Zone

## ■ Moral Crumple Zone: [Elish 2019]

- Blaming nearest convenient human for an automation failure

Backup Driver Of Autonomous Uber SUV Charged With Negligent Homicide In Arizona

2020 – <http://bit.ly/3Mwp1BG>

## ■ Ineffective ways to improve safety:

- Blaming humans for exhibiting human error
- Blaming victims
- Liability immunity for manufacturers

**Tesla driver charged with manslaughter in deadly Autopilot crash raises new legal questions about automated driving tech**

A Tesla Model S driver accused of crashing his car while Autopilot was activated had run a red light and slammed into a Honda Civic, killing its occupants.

2022 – <http://bit.ly/3Mt9yIV>

# Rule #1: Driver Monitoring Rule

- **Manufacturer responsible for distracted Human Driver crash unless:**
  - Effective distracted driver alert activated,  
AND
  - Alert lasts at least 10 seconds before crash,  
AND
  - Computer Driver ensures safety for those at least 10 seconds.
- **Exception:**
  - Malicious defeat of driver monitor

<https://bit.ly/401oLxM>

# Rule #2: Driver Intervention Rule

- **Manufacturer responsible for Human Driver failure to intervene unless:**
  - **Undue risk of mishap readily apparent with enforced level of attentiveness, AND**
  - **Human Driver has adequate opportunity to intervene**
    - Safe harbor for first 10 seconds

<https://bit.ly/33L0Bk7>

- **Computer Driver can demand that Human Driver intervene – but must follow this rule**

# Implications: “Readily Apparent”

- Must be obvious deviation from safe driving
  - Computer Driver deviates from its customary behavior
  - Conventional driver would recognize a danger
    - Given only amount of attention that is enforced
- Alarms can make issues readily apparent:
  - ODD departures
  - Equipment failures
- Operational concept affects this
  - Eyes-on-road makes road hazards more apparent
  - Eyes-off-road concepts make hazards less apparent

<https://bit.ly/3GxJ2E6>

# “Adequate Opportunity To Intervene”

## ■ Human driver readiness

- Attention and tasking status both matter

## ■ Time to react

- Enough time appropriate to circumstances
  - Time to recognize Computer Driver acting unsafely
  - Time to switch tasks
    - » What if watching a movie?
    - » What if hands full?
  - Complexity of road situation, severity of failure, etc.
  - Competent (not expert) driver can reasonably intervene successfully
- Computer Driver ensures safety during reaction time

[Dall-e]

# Summary: Driving Safety Responsibility

- **Autonomous mode**
  - Manufacturer – not owner, not the computer itself
- **Testing mode**
  - Test driver might contribute, but not a scapegoat
- **Supervisory mode**
  - Manufacturer except:
    - Rule 1: Human Driver ignores effective driver monitor
    - Rule 2: Human Driver had a fair chance to intervene
  - Manufacturer must respect inherent human limits

# What Happens Next?

## ■ Implementation: State Liability Laws

- Sets a well-defined playing field for liability
- Based on “reasonable” driver behavior
  - Uses same legal rules applied to human drivers
  - Source code analysis not required

## ■ Technical implications

- Indirectly regulates driver monitoring effectiveness
  - Can only take credit for driver attention that can be monitored
  - Monitoring sophistication higher for aggressive operational modes
- Indirectly affects viable concepts of operation
  - Disincentivizes some moral crumple zone strategies
